Instructions for using the smart electricity meter

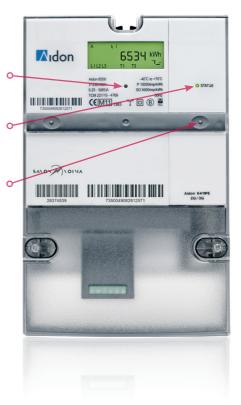

Your electricity consumption in this building is measured remotely with a smart meter made by Aidon. Savon Voima Verkko obtains your electricity consumption data in kilowatt hours for billing purposes by reading your smart meter remotely once a day automatically via a data transfer connection. This means you no longer need to submit meter readings.

Indicator lights and buttons on the meter

Flashing light indicating electricity consumption

Metering device's status indicator light o

Pressing the display scroll button speeds up the readings, date and time and transformation ratio that appear on the display.

Keep track of your electricity consumption and save energy!

Interpreting the meter's display

The kilowatt hour remote-meter readings allow you to monitor your electricity consumption. You can find all of the readings used for your billing in the kilowatt hour meter's display.

The meter readings change on the screen approximately every 20 seconds. The readings are displayed without a zero in front and as whole numbers. The reading(s) have been multiplied by the transformation ratio.

Data displayed

- Time (hour:minute:second)
 The time is always the 'normal time', and does not switch to daylight savings time.
- Date (day:month:year)

t1

general electricity reading off-peak electricity daytime reading/seasonal electricity winter daytime reading

T1 = metering data logged in the T1 register

t2

off-peak electricity night reading/seasonal electricity other time reading off-peak electricity, at night/seasonal electricity

T2 = metering data logged in the T2 register

Information on the situation at the time of the transfer to remote meter reading
